

DELTA LOGIC Connectivity Service

VPN service for secure access to your systems

DELTA LOGIC Connectivity Service gives you the ability to set up and manage your own VPN. Just a few clicks and you can integrate the equipment relevant to you, e.g. PCs, routers and locally connected network devices (e.g. PLCs or HMIs). As a result, you can customize the VPN to your needs with minimal effort and maximize the efficiency of your remote maintenance.

Perfect fields of application

The DELTA LOGIC Connectivity Service is ideally suited to setting up and administering VPNs of almost any size and complexity - with the highest possible security. Every client must pass certificate-based authentication (X.509) before being allowed to establish the encrypted connection to the portal. These certificates can be automatically renewed at regular intervals.

Even within the VPN, you can increase security through access controls. Assigning subscriber units to different groups clearly defines which device can communicate with which remote station. The integrated firewall means it's also possible to restrict this data traffic even more specifically (based on IP addresses, ports and protocols).

In addition, this VPN portal offers the possibility of internal monitoring. Here, the connection to the VPN clients or end devices is checked at regular intervals. In the event of a break in the connection, you can be notified directly via e-mail.

Varied ranges of application

To learn about the capabilities and deployment range of the DELTA LOGIC Connectivity Service, we invite you to test it for free. To this end, we'll provide you with four licenses without obligation for a period of four weeks. Simply register directly at the [website of the DELTA LOGIC Connectivity Service](https://connectivity.deltalogic.de):
